- Submitting a file upload
- File Types h, and, and cpp

Programming Assignment

Write a program that implements the ADT *vehicle* (a class with at least one pure virtual function). Information you may want to keep about a vehicle includes

- identification information
- empty weight
- maximum gross weight
- maximum range
- maximum speed

The constructor should take all such information as arguments. Include virtual functions (may be pure or impure) for interrogating each such attribute. Also include a pure virtual function for interrogating the transportation mode.

Construct derived classes *airplane*, *boat*, and *car* each derived directly from *vehicle*. Each derived class should provide an interrogation function for the transportation mode, which should indicate by-air, by-land, or by-water (or something similar).

Write a short program which instantiates at least one object of each derived type. Verify all operations work correctly.

Submit your source code as attachments to the drop box for this module's programming assignment. You can find the drop box at the end of this module's tab page. Do not compress your attachments. Please review the requirements for submitting on the course syllabus.
