

Topic 7.6

7.6: Multiple Inheritance

The following code fragment illustrates the basic mechanics of multiple inheritance:

```
class Vehicle
{
    public:
    int    n_psg;
    char   color[80];
    float  fuel_capacity;
    float  fuel_level;

    void   print();
}

class House
{
    public:
    char   color[80];
    int    square_footage;
    float  refrigerator_capacity;
    float  counterspace;

    void   print();
}

// Part vehicle, part house.
class MotorHome : public Vehicle, public House
{
}

int main(void)
{
    MotorHome winnebago;

    // No ambiguity.
    cout << winnebago.fuel_capacity;

    winnebago.Vehicle::print();    // Need class
                                   // qualification
    winnebago.House::print();      // because of
                                   // ambiguity.

    return 0;
}
```
